Annexure: AI Use Declaration

MedlyDose | Chhavi Bansal | BCA3

AI tool used: Claude (Anthropic), as a coding and writing assistant for the core application. No other AI tool was used. Most of the application code was written by the AI from my instructions. My own part was the decisions, the testing on my own computer, the review, and putting it together. The table summarizes what I asked it to do and what I did myself for the core application.

AI tool	What I asked it to do	What I wrote, changed or checked myself
Claude (Anthropic) Project idea and scope	I asked for project ideas and how to shape one at the right level for the hackathon.	I chose the medicine and reminder topic, the scope, and the name MedlyDose. I kept the project to four healing mechanisms and decided which features to drop.
Claude (Anthropic) Application code (Flask, SQLite)	I asked it to write the web app: pages, JSON API, medicine and dose records, reminders, the calendar and history.	I ran the app on my own computer, used it as a user would, and reported bugs and missing behaviour with screenshots until it worked as I wanted.
Claude (Anthropic) Self-healing mechanisms	I asked it to write the watchdog, the circuit breaker, the offline queue with sync, and the data quarantine.	I decided which mechanisms to keep, asked for the flood-protection feature to be removed, and chose the data wipe as the unhealable failure. I tested the implementation on my computer and reviewed it.
Claude (Anthropic) Interface and design	I asked it to build the screens from my instructions: the Remind me bell and Taken button, the calendar, the welcome page, the Health page, and the colour palette in light and dark.	I gave the design instructions, reviewed every screen, and asked for changes, for example removing the login, removing boxes around labels, and tidying spacing.
Claude (Anthropic) Debugging	I asked it to explain failures and fix them. It found a timing problem in SMS recovery and a false data-loss alarm.	I reproduced the failures on my machine, applied the fixed files, and re-ran the tests until every healable failure recovered inside 30 seconds.

Declaration

This declaration covers AI assistance for the core application implementation described in the table above. I can explain the application code, including how each of the four self-healing mechanisms works and why the data-wipe failure cannot be healed.
