Annexure: AI Use Declaration

MedlyDose | Chhavi Bansal | BCA3

AI tool used: Claude (Anthropic), as a coding and writing assistant for the whole project. No other AI tool was used. Claude wrote most of the code and report text from my instructions; I made the decisions, tested on my own computer, reviewed everything and put it together.

AI tool	What I asked it to do	What I wrote, changed or checked myself
Claude (Anthropic) Project idea and scope	I asked for project ideas and how to shape one at the right level for the hackathon.	I chose the medicine and reminder topic, the scope, and the name MedlyDose. I kept the project to four healing mechanisms and decided which features to drop.
Claude (Anthropic) Application code (Flask, SQLite)	I asked it to write the web app: pages, JSON API, medicine and dose records, reminders, the calendar and history.	I ran the app on my own computer, used it as a user would, and reported bugs and missing behaviour with screenshots until it worked as I wanted.
Claude (Anthropic) Self-healing mechanisms, helper services and chaos tools	I asked it to write the watchdog, the circuit breaker, the offline queue with sync, the data quarantine, the simulated SMS and caregiver services, and the chaos script and Chaos page.	I decided which mechanisms to keep, asked for the flood-protection feature to be removed, and chose the data wipe as our honest unhealable failure. I tested each failure on the Chaos page and ran chaos.py on my computer several times to produce the final measurements.
Claude (Anthropic) Interface and design	I asked it to build the screens from my instructions: the Remind me bell and Taken button, the calendar, the welcome page, the Health page, and the colour palette in light and dark.	I gave the design instructions, reviewed every screen, and asked for changes, for example removing the login, removing boxes around labels, and tidying spacing.
Claude (Anthropic) Debugging	I asked it to explain failures and fix them. It found a timing problem in SMS recovery and a false data-loss alarm.	I reproduced the failures on my machine, applied the fixed files, and re-ran the tests until every healable failure recovered inside 30 seconds.
Claude (Anthropic) Report, README, video script and Git help	I asked it to build the Resilience Report layout and charts, draft the README, the voiceover script and a subtitle text, and give step-by-step Git commands.	I supplied my own measured results and checked them against my terminal output, edited the script wording, recorded the voiceover and put the video together, and ran every Git command myself.

Declaration

I declare that this table is a complete and honest account of how AI was used in this project, and that I can explain every part of the code and report, including the four self-healing mechanisms and why a data wipe cannot be healed.
